

# INTRODUCTION TO MACHINE LEARNING COMPSCI 4ML3

LECTURE 12

HASSAN ASHTIANI

# EXPECTED ERROR MINIMIZATION

- THE SOLUTION TO  $\boxed{\mathbf{y}^*} = \operatorname{argmin}_{\hat{\mathbf{y}}} E_{X,Y} (\mathbf{Y} - \hat{\mathbf{y}}(\mathbf{X}))^2$ 
  - Is  $y^*(x) = E[Y|X = x]$
- IN PRACTICE, WE DON'T KNOW  $P(X, Y)$ 
  - CANNOT CALCULATE  $y^*(x)$
- INSTEAD, WE HAVE  $Z = \{(x^i, y^i)\}_{i=1}^n$ 
  - WE HAVE USED  $Z$  TO FIND PREDICTOR  $\widehat{\mathbf{y}}_Z$
- WHAT CAN WE SAY ABOUT  $E_{x,y} (\mathbf{y} - \widehat{\mathbf{y}}_Z(\mathbf{x}))^2$ ?

# ERROR DECOMPOSITION

$$\begin{aligned} & \bullet E_{x,y} (y - \widehat{y}_z(x))^2 \\ &= E_{x,y} (y - y^*(x))^2 + E_x (y^*(x) - \widehat{y}_z(x))^2 \\ &= \underbrace{\text{noise}}_{\text{---}} + \underbrace{\text{ESTIMATION ERROR}}_{\text{---}} \end{aligned}$$

Does not  
depend on  $\widehat{y}$

$$E_{(x,y) \sim P(x,y)} \left( y - \hat{y}_z(x) \right)^2 =$$

$\hat{y}_z$

$y^*(x) = E[y|x]$

$$\underset{(x,y)}{\approx} E \left( y - y^*(x) + y^*(x) - \hat{y}_z(x) \right)$$

$$\underset{x,y}{=} \underbrace{E \left( y - y^*(x) \right)^2}_{\text{noise}} + \underbrace{E \left( \hat{y}_z(x) - y^*(x) \right)^2}_{\text{estimation error}} + 2 E \left( y - y^*(x) \right) \left( \hat{y}_z(x) - y^*(x) \right)$$

cross term = 0

cross term:

$$2 E_{x \sim P(x)} \left( E_{y \sim P(y|x)} \left[ \underbrace{y \cdot y^*(x)}_{\cancel{y^*(x) y^*(x)}} + \underbrace{y^*(x) \hat{y}_z(x) - y \hat{y}_z(x)}_{\cancel{- y^*(x) \hat{y}_z(x)}} - \underbrace{y^*(x) y^*(x)}_{\cancel{- y^*(x) y^*(x)}} \right] \right)$$

$$= 2 E_{x \sim P(x)} \left[ \cancel{y^*(x) y^*(x)} + \cancel{y^*(x) \hat{y}_z(x)} - \cancel{y^*(x) y^*(x)} - \cancel{y^*(x) \hat{y}_z(x)} - \cancel{y^*(x) y^*(x)} \right]$$

# BIAS-VARIANCE DECOMPOSITION

- DOES  $E_{x,y}(\mathbf{y} - \widehat{\mathbf{y}}_Z(\mathbf{x}))^2$  CAPTURE THE QUALITY OF OUR “ESTIMATION METHOD”?  $\in Z$ 
  - DEPENDS ON  $Z$ ....
  - HOW GOOD IS AN ESTIMATOR “ON AVERAGE”?

$$\xrightarrow{\text{E}_Z} E_{x,y}(\mathbf{y} - \widehat{\mathbf{y}}_Z(\mathbf{x}))^2 = ?$$

E.G., FOR LINEAR ESTIMATOR:

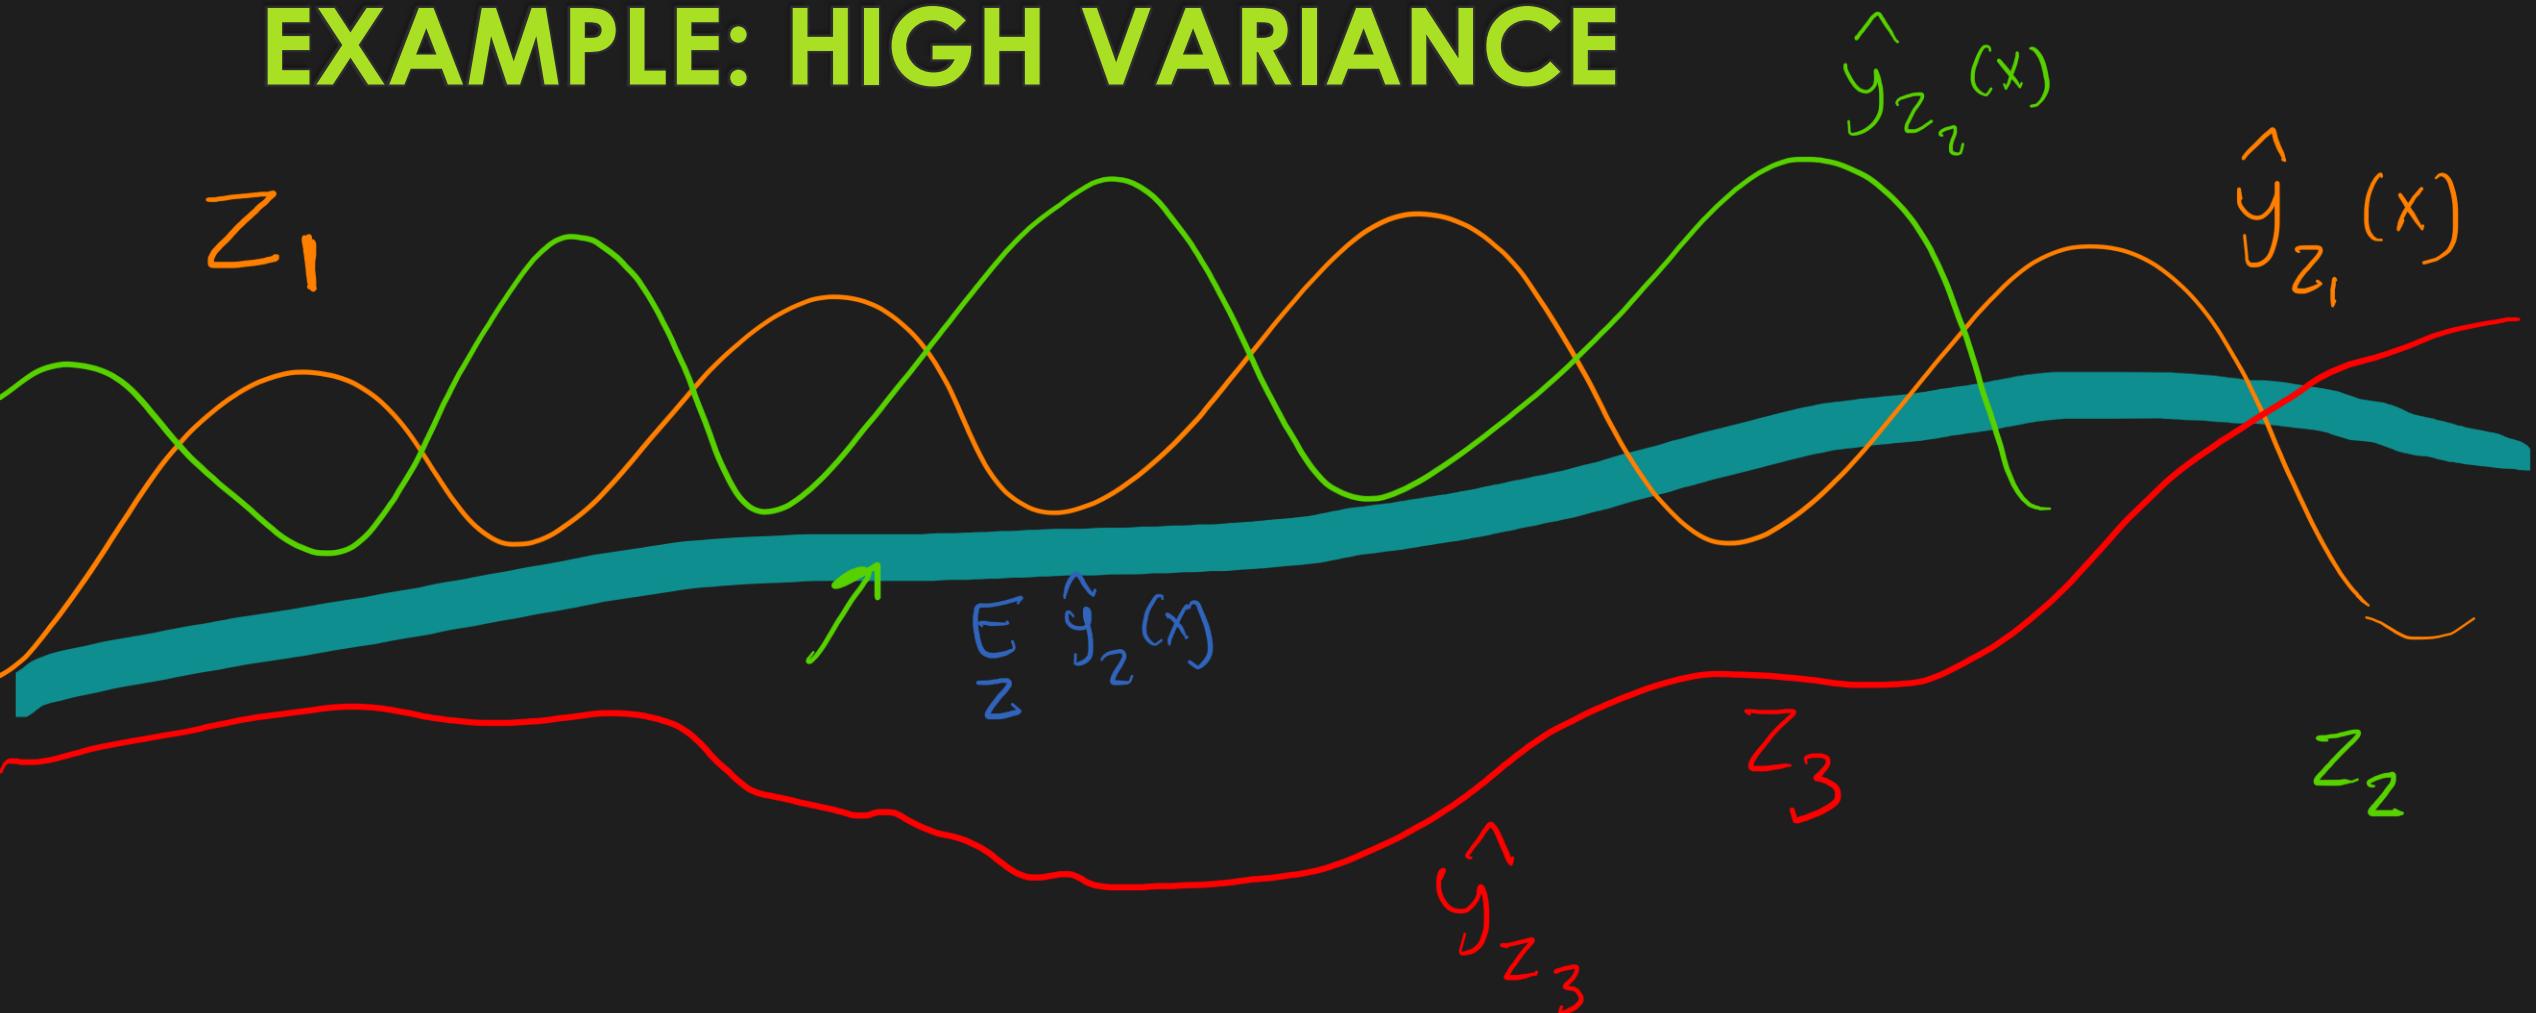

$$E_Z E_{x,y}(\mathbf{y} - W_Z^T \mathbf{x})^2 = ?$$

# BIAS-VARIANCE DECOMPOSITION

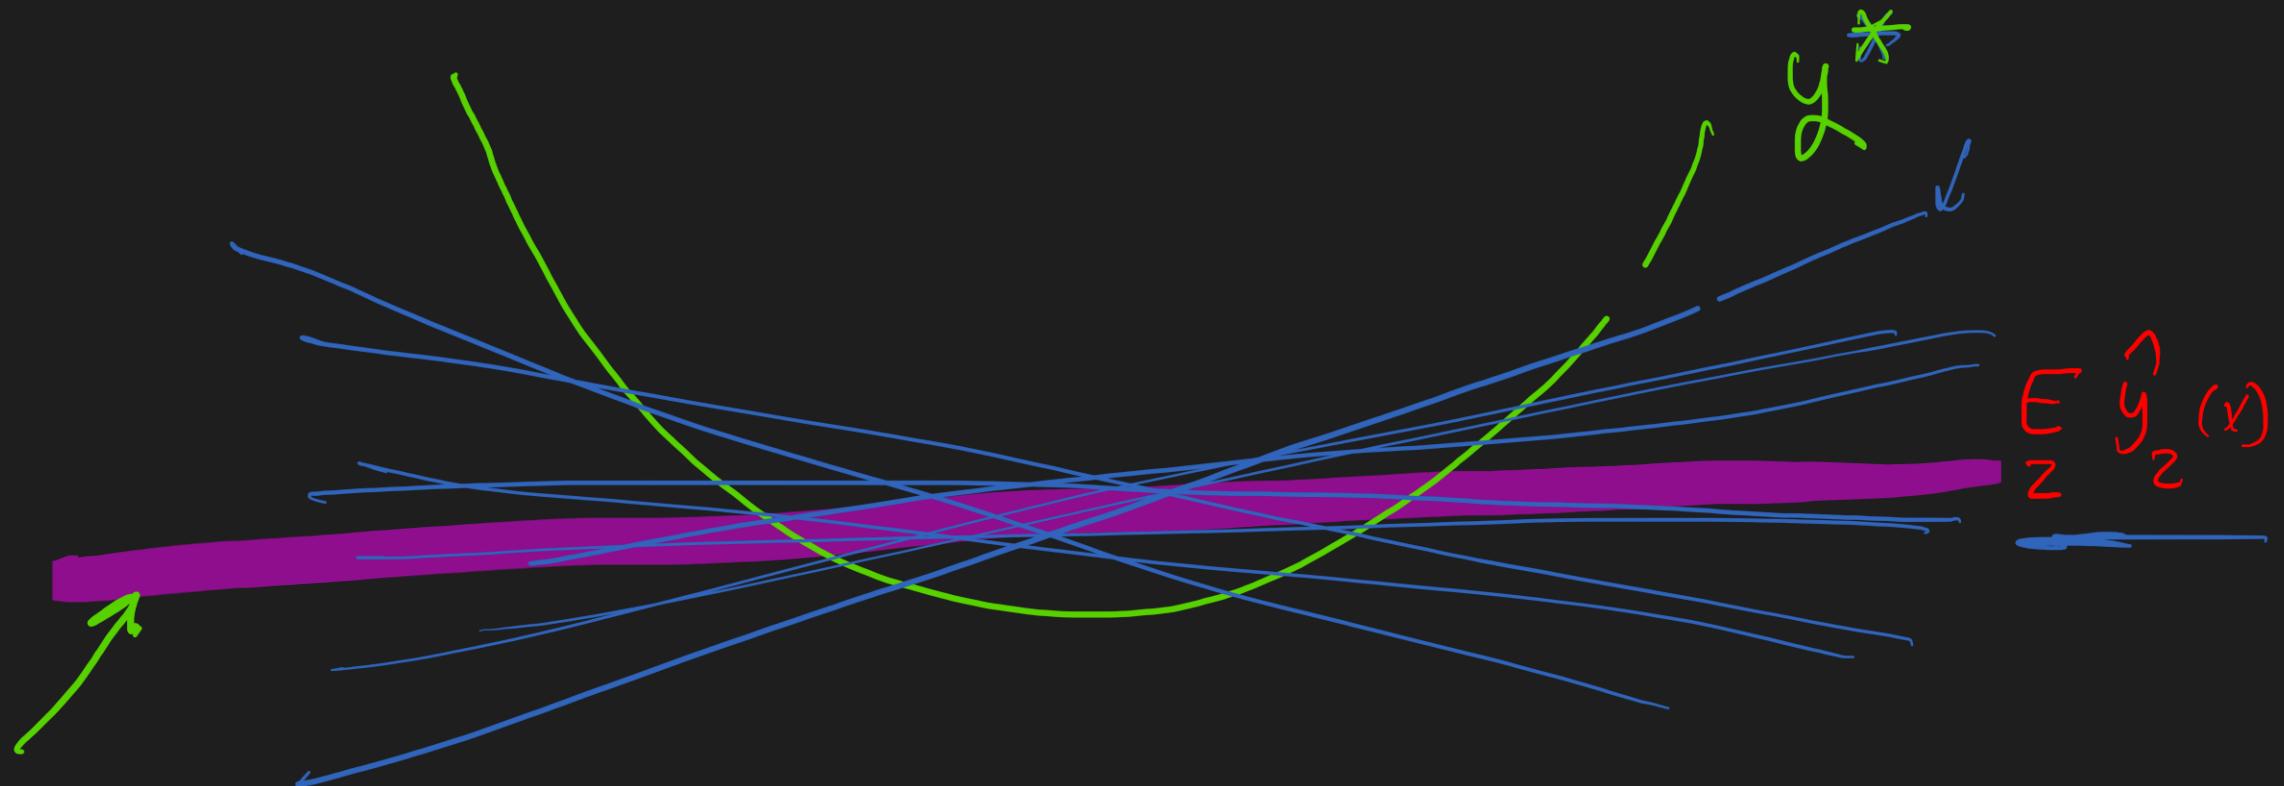

$$\begin{aligned} \underline{\underline{E}_Z E_{x,y} (y - \widehat{y}_Z(x))^2} \\ = & E_{x,y} (y - y^*(x))^2 \quad \stackrel{\rightarrow}{\text{(NOISE)}} \\ & + E_x (\underline{y^*(x)} - \underline{E_Z(\widehat{y}_Z(x))})^2 \quad \stackrel{\leftarrow}{\text{(BIAS)}} \\ & + E_x E_Z (\widehat{y}_Z(x) - \underline{E_Z(\widehat{y}_Z(x))})^2 \quad \stackrel{\leftarrow}{\text{(VARIANCE)}} \end{aligned}$$

Annotations: Orange underlines are placed under  $y^*(x)$ ,  $E_Z(\widehat{y}_Z(x))$ , and  $E_Z(\widehat{y}_Z(x))$ . Red arrows point from these underlined terms to the corresponding labels: (NOISE), (BIAS), and (VARIANCE).

# EXAMPLE: HIGH VARIANCE

**EXAMPLE: HIGH BIAS**, low Variance

Low bias, high variance?
